

1. Clean the socket and the plain end. Lubrication and additional cleaning should be provided by brushing both the gasket and the plain end with soapy water or an approved pipe lubrication meeting the requirement of ANSI/AWWA C111/A21.11.

Just prior to slipping the gasket onto the plain end for joint assembly. Place the gland on the plain end with lip extension toward the plain end, followed by the gasket with the narrow edge of the gasket toward the plain end. [The gasket provided may have been the EBAA-SEAL® Improved Mechanical Joint Gasket, the EBAASEAL does not have a narrow edge and is bi-directional. It's use with certain sizes of MEGALUGS® is required to achieve the rated pressure.]

NOTE: In cold weather it is preferable to warm the gasket to facilitate assembly of the joint.
2. Insert the pipe into the socket and press the gasket firmly and evenly into the gasket recess. Keep the joint straight during assembly.
3. Push the gland toward the socket and center it around the pipe with the gland lip against the gasket. Insert bolts and hand tighten nuts. Make deflection after joint assembly but before tightening bolts.
4. Tighten the bolts to the normal range of torque as indicated [3inch 45-60 ft.-lbs., 4 through 24 -inch $75-90$ ft-lbs., 30 and 36 -inch $100-120 \mathrm{ft}$.-lbs., and 42, 48 and 54-inch 120-150 ft.-lbs.] while at all times maintaining approximately the same distance between the gland and the face of the flange at all points around the socket. This can be accomplished by partially tightening the bottom bolt first, then top bolt, next the bolts at either side, finally the remaining bolts. Repeat the process until all bolts are within the appropriate range of torque. In large sizes (30-64 inch [762-1,600mm]), five or more repetitions may be required. The use of a torque-indicating wrench will facilitate this procedure.

Table 1 - Mechanical Joint Bolt Torques

| Pipe Size |  | Bolt Size |  | Range of Torque |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| in. | mm | in. | mm | $\mathrm{ft} \cdot \mathrm{lb}$ | $\mathrm{N} \cdot \mathrm{m}$ |
| 3 | 76 | 5/8 | 16 | 45-60 | 61-81 |
| 4-24 | 102-610 | $3 / 4$ | 19 | 75-90 | 102-122 |
| 30-36 | 762-914 | 1 | 25 | 100-120 | 136-163 |
| 42-64 | 1,067-1,600 | $11 / 4$ | 32 | 120-150 | 163-203 |

| Nominal Pipe Size |  | Cross Sectional Area of Pipe $\dagger$ (sq. in.) | Gland |  |  |  | Bolt Holes |  |  | Bell |  |  | C110 Fittings <br> (Thick Wall) |  |  |  | C153 Fittings <br> (Thin Wall) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\dagger$ The Cross Sectional Area of the pipe is based on the outside diameter of the pipe.
$\ddagger$ The MEGALUG® Series 1142 and 1148 requires and are supplied with $81 / 2$ inch t-Bolts
*The MEGALUG® Series 1154 requires and are supplied with $91 / 2$ inch t-Bolts
§The MEGALUG® Series 1160 requires and are supplied with 11 inch t-Bolts

At EBAA Iron, all of our products are tested with a minimum safety factor of $2: 1$. Therefore, all of our products have been tested to at least twice the rated pressure of the restraint device. To determine the amount of force held by a joint restraint device at a certain pressure, obtain the cross sectional area of the pipe size from the table above and multiply that number by the desired pressure. The result will be the equivalent dead end thrust load resisted by the restraint at the chosen pressure.

For Example - The dead end thrust of a 12 inch joint at 350 PSI would be:
Thrust $=136.9 \times 350=47,915$ pounds of force

## Area $=\pi D^{2} / 4$

Where $\pi=3.1416$ and $D=$ Pipe O.D.
